- 126,105,031** Now that I've selected, can't deselect. Wednesday, May 20th 10:52AM
- 126,046,771** Allow us to edit our own theme files directly Tuesday, May 19th 2:59PM
- 126,042,686** The above, only use Git instead of SVN. Tuesday, May 19th 1:51PM
- 125,787,222** Both above plus lock the CSS editor in Jetpack Tuesday, May 12th 7:06PM
- 124,927,100** why not both, add features to jetpack that would allow sass/css with repository tracking Tuesday, May 5th 3:38PM
- 124,927,062** I am really fine either way Tuesday, May 5th 3:47PM

### Do you have any feedback you'd like to share on this topic?

- 126,191,663** I wish I didn't have to use the admin editor, I would love to have an actual CSS file that I could edit! Also, being about to commit images files via SVN would be great too. I always build my WordCamp sites as child themes locally and then upload the images to the media library and paste the stylesheet into the admin editor. If I could keep a consistent workflow between local and live that would make things much simpler and I think sharing those "child" themes with other WordCamp organizers would be easier. Thursday, May 21st 3:22PM
- 126,188,212** See above. :) Thursday, May 21st 2:32PM
- 126,107,826** I would \*love\* to have a repository to commit to for managing this Wednesday, May 20th 11:23AM
- 126,105,031** I'm happy with the CSS editor. Wednesday, May 20th 10:52AM

 126,046,771	I don't get why we are limited to just CSS. Open it up. Let us create without limitations. Security issues and concerns? They can be figured out.	Tuesday, May 19th 2:59PM
 126,042,686	Please, please, PLEASE no more SVN.	Tuesday, May 19th 1:51PM
 125,937,906	I have a local WordCamp plugin that I use to create the initial batch of CSS that I upload to the editor. This plugin has gulp for working with LESS and a few other tools. This lets me start locally then move to the online editor when things are close to being ready.	Monday, May 18th 9:15AM
 125,937,711	Anything that will allow us to develop closer to normal setup will be of great help.	Monday, May 18th 9:16AM
 125,787,222	I'm not advanced enough for the alternative solution above but there needs to be a better way to track changes that multiple organizers make to the CSS and to prevent two people making changes at the same time and overwrite each other. Like locking the post editing.	Tuesday, May 12th 7:06PM
 125,623,227	I used the addon GhostText for Chrome which lets you sync code that you edit in Sublime Text with the browser window of the CSS editor – a great combo, which works perfectly for my purposes. Fixing the revision (if that is a bug) in Jetpack would be great.	Friday, May 15th 1:00AM
 125,069,945	I think the current CSS editing experience is great for simple customizations but once you go past simple colour changes, it becomes effort. Building an advance CSS solution would allow simple css changes to stay simple and more advance CSS changes be more advance.	Thursday, May 7th 8:24AM
 125,003,607	Everyone said that being able to work on it locally might be nice but it sounds like a big hassle to me (and I love my editor). Also SVN? Really? I wouldn't put anything more on SVN that you had to. Git is a million times better - we should be spending time on that and bringing WordPress development practices up to speed, not making it easier for lazy WordCamp organizers to edit sites (and I'm on of those too).	Wednesday, May 6th 1:15PM
 124,982,536	I'm not sure I know how else it can be better. That may change after I hear other's suggestions	Wednesday, May 6th 8:34AM
 124,968,824	I'm torn. I would like to contribute to Jetpack and improve it since that would affect fare more people in a hopefully positive manner. I also would like a standalone since we may try adding features to Jetpack that most users would not need and would lean on more for edits than child themes. Then again, many people never use child themes and edit their themes directly.	Wednesday, May 6th 6:29AM
 124,952,191	A GitHub integration would be nicer than SVN, purely because that would fit into our existing workflow more smoothly. That being said - any option that doesn't involved editing code in the dashboard is good with me.	Wednesday, May 6th 12:51AM
 124,930,935	Git? Pretty please?	Tuesday, May 5th 4:55PM
 124,927,100	I want it all - j/k	Tuesday, May 5th 3:38PM
 124,925,887	Exactly that — let me edit everything locally and upload.	Tuesday, May 5th 3:30PM
